

Next-Generation CIS

(Acuity Care Technology, December 2003 / January 2004)

The MetaVision Suite of clinical information systems is designed to aid clinicians by automating workflow and documentation processes within the critical care environment. Supported by powerful tools for auditing and analysis, it enables hospitals to streamline data collection, manage costs, reduce errors and improve outcomes. New display options include a Graphic Patient List; cursor-based time-stamping; an advanced tabular display with zoom-in; and a range of powerful options for graphs, such as combined curves and multiple scales.

Project managers benefit from the customization tool's new features. All levels of system elements may be customized including layout elements such as colors, toolbars, buttons, and even shortcut keys are all customizable. Clinicians with no programming knowledge may now use generators to easily create their own forms and reports. Forms may be Web-enabled, allowing clinicians remote access from any location.
